程序代写代做 CS编程辅导

## Forecast Accuracy

- One approach to measuring the accuracy of a forecast is to use Mean Absolute Percent Error (MAPE). This is the average error of a series of forecasts.

WeChat: cstutorcs

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

QQ: 749389476

$\hat{y}_i$  = forecast at period  $i$

$y_i$  = actual value period  $i$

<https://tutorcs.com>

$n$  = number of terms evaluated

<https://flux.qa> (Feed code: SU0KGV)

## Question 1

For a forecast value of 15 and an observed value of 20 APE is:

- A. - 0.25
- ✓ B. + 0.25
- C. - 0.33
- D. + 0.33
- E. + 0.75

WeChat: cstutorcs

Assignment Project Exam Help

Email:  $APE = \frac{|\hat{Y}_i - y_i|}{y_i}$  tutorcs@163.com

QQ: 749389476

$APE = \frac{|15 - 20|}{20}$   
<https://tutorcs.com>

# Group Activity 程序代写代做 CS编程辅导

To forecast:

$$\hat{y}_{t+1}$$

$$(y_t - \hat{y}_t)$$

For forecast accuracy

$$= \frac{|\hat{Y}_i - y_i|}{y_i}$$

$$MAPE = \frac{\sum_{i=1}^n \frac{|\hat{Y}_i - y_i|}{y_i}}{n}$$

WeChat: cstutorcs

Observed ( $y$ )	Forecast ( $\hat{y}$ )	Error	APE
55			
59			
53			
48			
44			
50			
52			

The first 'forecast' value is always = 'observed'

程序代写代做 CS编程辅导

# Regression Based Forecasting

- When data has a underlying linear trend, a linear model (equation) least squares regression can be fitted.
- This approach enables a longer term forecast to be made (in contrast to the one or two step forecasts using exponential smoothing).
- Simple linear models can be extended to include additive and multiplicative seasonality.

程序代写代做 CS编程辅导

# Regression Based Forecasting

- Model the following linear relationship...

程序代写代做 CS编程辅导

# Linear Regression of Time Series

- The first step in regression is to code the successive observations with an index.
- Typically use numbers, 1, 2, 3 ... or 0, 1, 2, ... for this task (assuming equal time intervals).

WeChat: cstutorcs

Assignment Project Exam Help

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

- Eg, for an example time series, we code:

QQ: 749389476

- Observation: 10, 7, 9, 12, ...

<https://tutorcs.com>

- Period: 1, 2, 3, 4, ...

## 程序代写代做 CS编程辅导

...

- Then make the regression calculations:

Period (X)		XX	YY	XY
1		1	100	10
2	7	4	49	14
3	9	9	81	27
4	12	16	144	48
5	7	25	49	35
6	9	36	81	54
7	3	49	9	21
8	8	64	64	64
9	6	81	36	54
10	9	100	81	90
11	8	121	64	88
12	4	144	16	48
13	5	169	25	65
14	2	196	4	28
<b>Σ</b>	<b>105</b>	<b>99</b>	<b>1015</b>	<b>803</b>

## 程序代写代做 CS编程辅导

...

- A plot of observed values vs Least Squares fitted values.

# Forecasting

程序代写代做 CS编程辅导

- To forecast, extend the model beyond the observed data. The forecast for periods 15, 16, 17 and 18 is:

WeChat: cstutorcs

Period (X)	Data (Y)	Fitted (Y)
3	9	8.98
4	12	8.56
5	7	8.13
...	...	...
13	3	4.74
14	8	4.31
15		3.89
16		3.47
17		3.05
18		2.62

Assignment Project Exam Help

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

QQ: 749389476

<https://tutorcs.com>

using least square equation, substitute x values for period 15, 16, 17 & 18

程序代写代做 CS编程辅导

# Accuracy of the Forecast

- If the observed data at periods 15 to 18 are subsequently found to be 4, 6, 5, 2, then MAPE is:

Period (X)	Data (Y)	Fitted (Y)	APE
3	9	8.98	
4	12	8.56	
5	7	8.13	
...			
13	3	4.74	
14	8	4.31	
15	4	3.89	0.03
16	6	3.47	0.42
17	5	3.04	0.39
18	2	2.62	0.31
		MAPE	

APE =  
Abs Error/Actual  
=  $\frac{|4 - 3.89|}{4} = 0.03$

Forecasting

程序代写代做 CS编程辅导

# Forecasting Seasonal Data

- When forecasting seasonal data we need to observe whether the model follows an additive or multiplicative model.
- If the underlying model is additive then multiple regression is the usual approach to modelling the time series. *(not covered in this course)*
- If the underlying model is multiplicative, then seasonal indices can be determined and the deseasonalised series can be forecasted.

WeChat: cstutorcs

QQ: 749389476

<https://tutorcs.com>

<https://flux.qa> <sup>程序代写 代做CS编程辅导</sup> (Feed code: SJ6KGV)

## Question 2

For motivating <sup>in</sup> data the best smoother to remove seasonal effect is:

- A. 3 MA
- B. 3 Med
- ✓ C. 4 CMA
- D. 5 MA

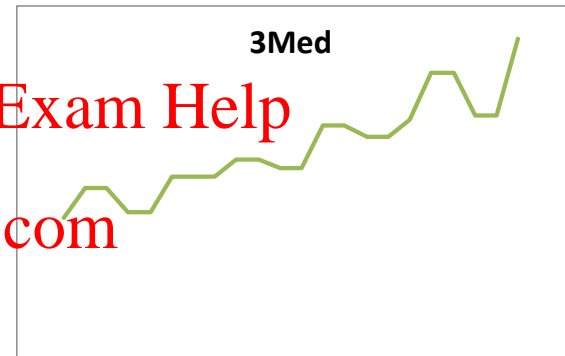

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

程序代写代做 CS编程辅导

# Multiplicative Model:

## Calculate Seasonal Indices

- The following steps are used to calculate the seasonal index
- Ratios to moving average method
  - The time series is smoothed. (Use 4 CMA for quarterly data).
  - Divide each observation by its corresponding moving average.
  - Calculate the average ratio for each season.
  - Normalise ratios (to have an average of 1)
  - Method can be adapted for periods of any length.

QQ: 749389476

<https://tutorcs.com>

# Example

程序代写代做CS编程辅导  

$$= \text{Average}(\text{average}(362, 385, 432, 341), \text{average}(385, 432, 341, 382))$$

$$= 382.5$$

Calculate the following indices for the following data:

Quarter	Sales	Centred 4 Period MA	Obs/MA
1	362		
2	385		
3	432	382.50	1.13
4	341	388.00	0.88
1	382	399.25	0.96
2	409	413.25	0.99
3	498	430.38	1.16
4	387	454.75	0.85
1	473	478.25	0.99
2	513	499.63	1.03
3	582	519.38	1.12
4	474	536.88	0.88
1	544	557.88	0.98
2	582	580.63	1.00
3	681	601.50	
4	557	627.63	

The observed value is 113% of what the trend predicts it to be.  
 ie  $432/382.5 = 1.13$ .

WeChat: cstutorcs

Assignment Project Exam Help

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

QQ: 749389476

<https://tutorcs.com>

Quarter	1	2	3	4		
	0.96	0.99	1.16	0.85		
	0.99	1.03	1.12	0.88		
	0.98	1.00				

Each average is multiplied by 4/3.99 to get calculate the index.

程序代写代做 CS编程辅导

# De-seasonalising Data

- De-seasonalise time series by dividing each observation by seasonal factor.

Period	Quarter	Sales	Index	Deseasonalised
1	1	362	0.98	369.39
2	1	385	1.01	381.19
3	3	432	1.14	378.95
4	4	341	0.87	391.95
5	3	382	0.98	389.80
6	2	409	1.01	404.95
7	3	498	1.14	436.84
8	4	387	0.87	444.83
9	1	473	0.98	482.65
10	2	519	1.01	507.92
11	3	582	1.14	510.53
12	4	474	0.87	544.83
13	1	544	0.98	555.10
14	2	582	1.01	576.24
15	3	681	1.14	597.37
16	4	557	0.87	640.23

De-seasonalised value  
 $= \frac{362}{0.98} = 369.39$

Trend  
and  
Error

# Seasonal Forecasting

- Having de-seasonalised the data, we can fit a least squares line of the form  $y = a + bx$  this will create a non-seasonal forecast using the trend equation.

WeChat: cstutorcs

- We can use this equation to create a trend for future periods.

Assignment Project Exam Help

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

- We then re-seasonalise the trend by multiplying by the seasonal indices.

QQ: 749389476

<https://tutorcs.com>

- The next slide shows all steps.

Period	Quarter	Sales	Index	Deseasonalised	Trend	Forecast	Slope	18.20
1	1	362	0.98	369.80	357.50		Intercept	321.10
2	2	385	1.01	381.19	357.50			
3	3	432	1.14	378.95	375.70			
4	4	341	0.87	391.95	393.90

https://tutorcs.com

using excel function to find the gradient and intercept of regression equation or using the least squares formula (in Lecture 8)

Equation of line:  
 $Y = 18.20x + 321.1$   
 For Period 17:  
 $Y = 18.2 \times 17 + 321.1 = 630.5$

Re-seasonalise trend:  
 - Multiply with index  
 For Period 17 → Qtr 1  
 Index for Qtr 1 = 0.98  
 $= 630.49 \times 0.98 = 617.88$
