Time Series

程序代写代做 CS编程辅导

- A Time Series ~~describes~~ is a set of observations made over a period of time. Daily maximum temperatures, hourly share price, annual population counts, weekly sales figures are all examples of time series.

WeChat: cstutorcs

- It is usual, but ~~not necessarily~~, that the observations are recorded at equal intervals.
Email: tutorcs@163.com

- Some examples of time series follow:

TS Analysis vs Forecasting

- Time series designates a set of observations made over a period of time; for example, the daily maximum temperatures, the share prices, annual population counts, weekly sales figures , etc.
- Time series analysis is the description and modelling of a time series. For instance we might attempt to describe patterns in the data with a mathematical model.
WeChat: cstutorcs
Assignment Project Exam Help
Email: tutorcs@163.com
- Forecasting is the method of attempting to predict the value of future observations from past data.
QQ: 749389476
- Forecasting from <https://tutorcs.com> great interest to business, for example in retailing and the financial sector.

Components of a Time Series

- Time series can be thought of as being composed of three elements:

- Trend, (absence of trend is ‘stationary’)
- Seasonal or cyclic element, and
- a Random component.

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Additive Model

程序代写代做 CS 编程辅导

- Data has an additive model when it is reasonable to assume that the trended time series can be explained as:

$$\text{Data} = \text{Trend} + \text{Seasonal Variation} + \text{Random Variation}$$

WeChat: cstutorcs

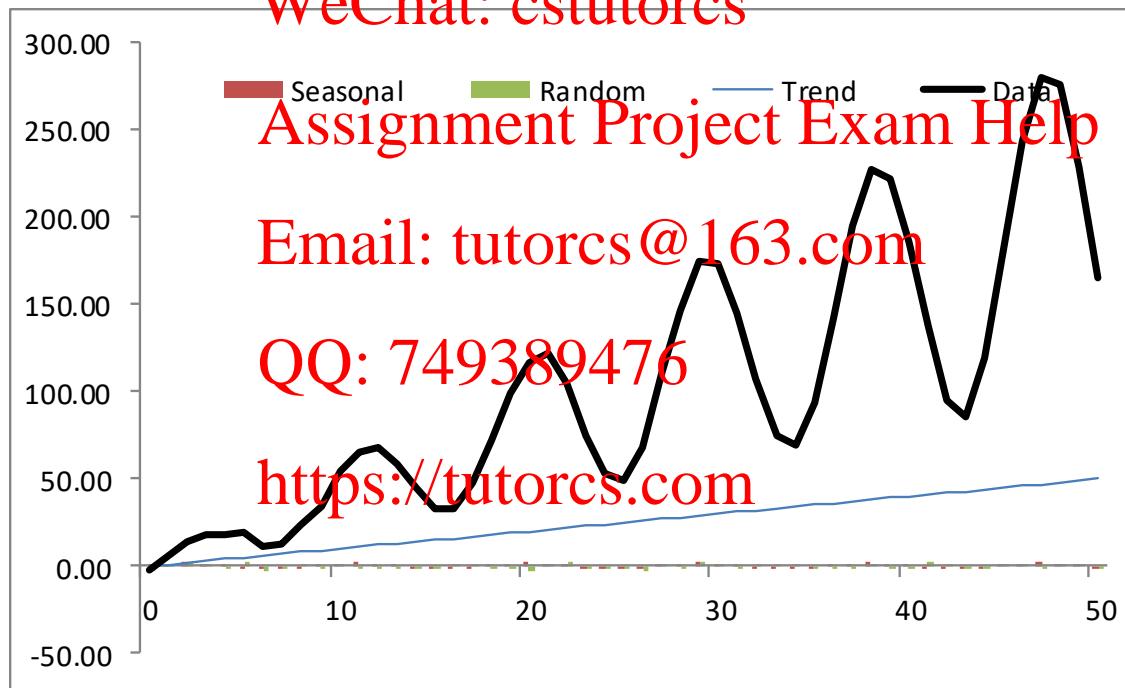

Multiplicative Model

- Data has a multiplicative model when it is reasonable to assume that the overall time series can be explained as:

$$Data = Trend * Seasonal Variation * Random Variation$$

The main features of this time series are:

- A. trend & random & seasonal additive
- ✓ B. trend & random & seasonal multiplicative
- C. Inconclusive

Moving Averages

程序代写代做 CS 编程辅导

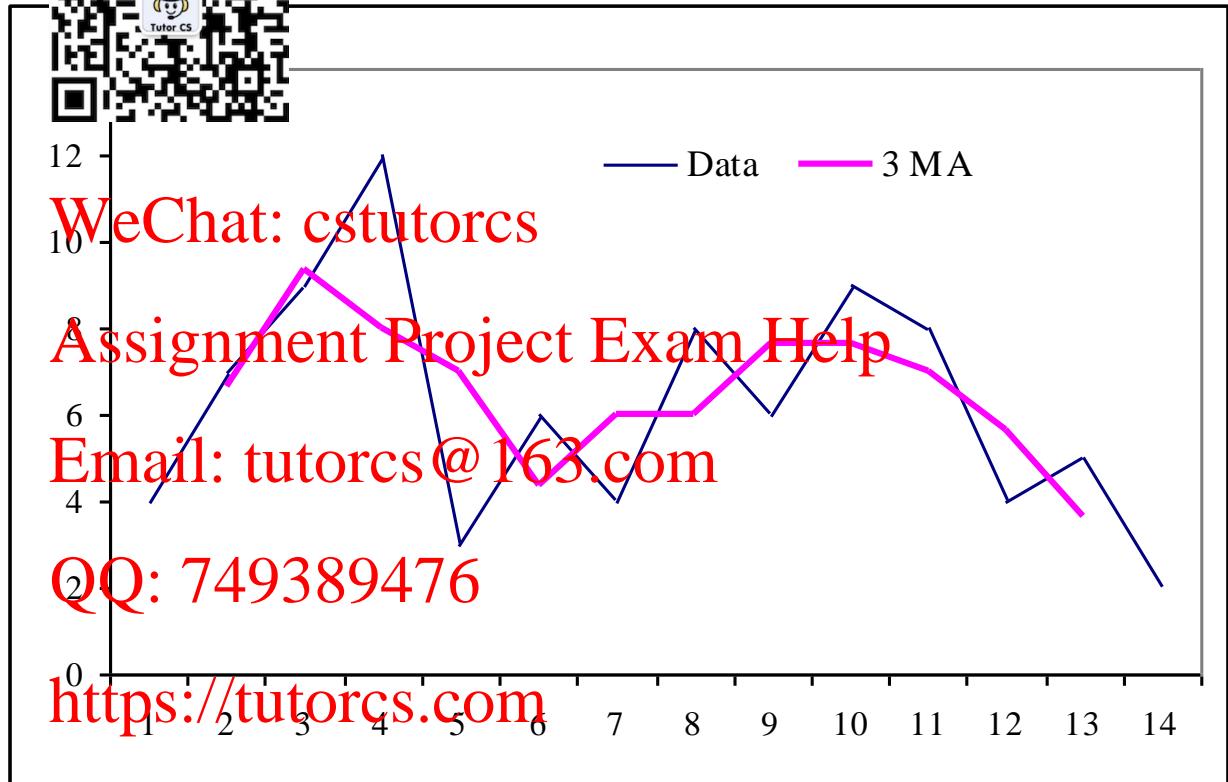

- One of the first tasks in time series analysis of **additive** time series is to smooth the data by calculating a moving average.
- As the name suggests, a moving average works by successively taking **Web Chat**, **Assignment Help**, **Project Help**, **Exam Help** over a number of periods and averaging. The average of the time indexes locates the moving average in time.
- Odd numbers of data are preferred for MA's because the data remains centred (time index is an integer), 3, 5, 7 being usual lengths. For quarterly data, a centred 4 period average is used. **Email: tutorcs@163.com**, **QQ: 749389476**, **Medians** are also used for robust smoothing.

3 Period Moving Average

程序代写代做 CS 编程辅导

Data	3 MA	3 MA
4		
7	$(4+7+9)/3$	6.67
9	$(7+9+12)/3$	9.33
12	$(9+12+3)/3$	8.00
3	$(12+3+6)/3$	7.00
6	...	4.33
4	...	6.00
8	...	6.00
6	...	7.67
9	...	7.67
8	...	7.00
4	...	5.67
5	...	3.67
2		

5 Period Moving Average

程序代写代做 CS 编程辅导

Data	5 MA	5 MA
4		
7		
9	$(4+7+9+12+3)/5$	7.00
12	$(7+9+12+3+6)/5$	7.40
3	$(9+12+3+6+4)/5$	6.80
6	...	6.60
4	...	5.40
8	...	6.60
6	...	7.00
9	...	7.00
8	...	6.40
4	...	5.60
5		
2		

Centred 4 Period Moving Average

- For quarterly data or data with cycles of 4 periods, a centred 4 period moving average is often used.
- The reasoning for this method is as follows:
 - The moving average contains 4 observations, which comprise a single cycle (Summer Autumn Winter Spring).
 - For observations in periods 1, 2, 3 and 4, the time index of the average is at period 2.5 i.e. between observations 2 and 3.
 - We thus take the average of pairs of off-centred observations to re-centre them.
 - This method can be adapted for other even numbered cycles.

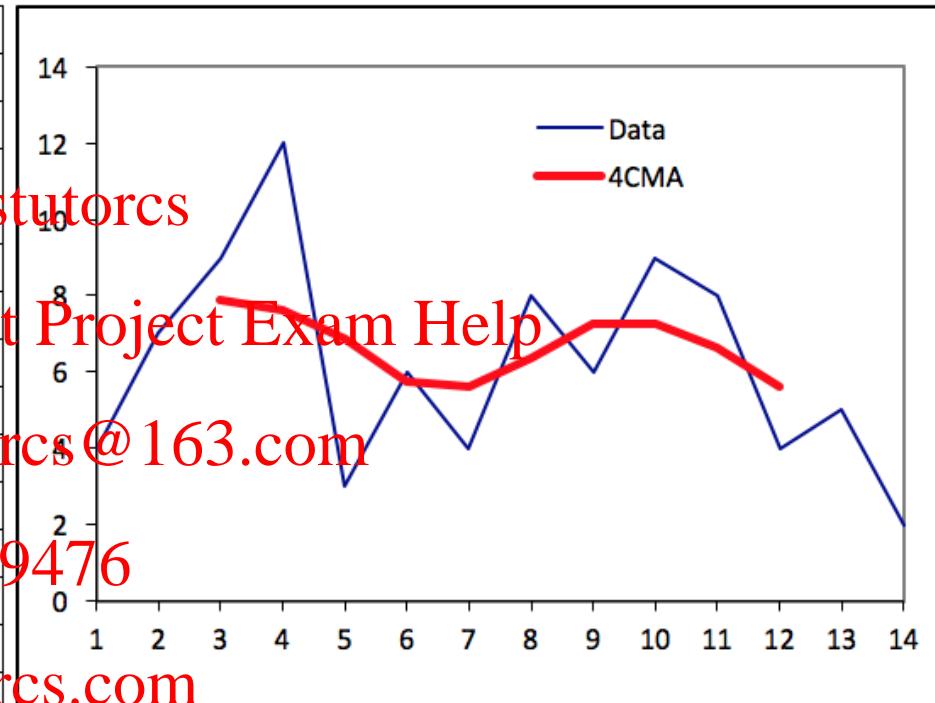

Centered 4 period moving average

Period	Data	4 MA
1	4	
2	7	$(4+7+9+12)/4 = 8.00$
3	9	$(7+9+12+3)/4 = 7.75$
4	12	$(9+12+3+6)/4 = 7.50$
5	3	$(12+3+6+4)/4 = 6.25$
6	6	...
7	4	...
8	8	...
9	6	...
10	9	...
11	8	...
12	4	...
13	5	...
14	2	...

<https://tutorcs.com>

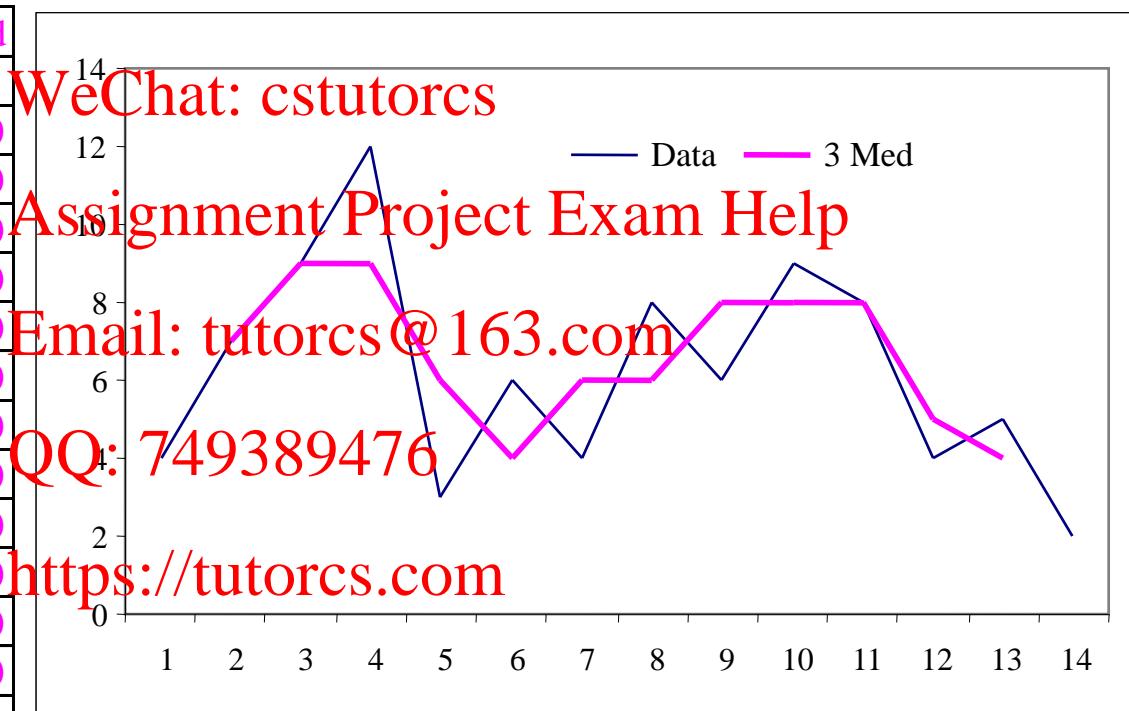

Smoothing With Medians

- Medians can also be used to smooth data. They are robust to outliers, although they are not as ‘smooth’ as means.

Data	3 Median	3 Med
4		
7	Median(4, 7, 9)	7.00
9	Median(7, 9, 12)	9.00
12	Median(9, 12, 3)	9.00
3	...	6.00
6	...	4.00
4	...	6.00
8	...	6.00
6	...	8.00
9	...	8.00
8	...	8.00
4	...	5.00
5	...	4.00
2		

Methods Compared (FIT1006 Lecture 19 and 20.xlsx)

Methods Compared: Graph

程序代写代做 CS编程辅导

Analysis of share prices

- Moving average for different periods are used by some share analysts to determine when a share is trending up or down. The figure below is from E*trade.

Exponential Smoothing

- Exponential smoothing is a way of forecasting one, two, three periods ahead, using historical data.
- Exponential smoothing uses an observation at time t as well as the forecast value at time t . The forecast for the following period is based on the current observation plus a proportion of the error observed in the current period.
WeChat: cstutorcs
Assignment Project Exam Help
Email: tutorcs@163.com
QQ: 749389476
- This method is called an adaptive technique as it makes use of the most recent information to correct (update) the forecast.

Exponential Smoothing cont.

- New forecast = previous forecast + α (previous actual - previous forecast)
- New forecast = previous forecast - α (error)
- α is between 0 and 1

WeChat: cstutorcs
Assignment Project Exam Help Error

$$\hat{y}_{t+1} = \hat{y}_t + \alpha(y_t - \hat{y}_t)$$

Arrows point from the labels to the corresponding terms in the equation:

- Forecast Next Period points to \hat{y}_{t+1}
- Forecast Current Period points to \hat{y}_t
- Observed Current Period points to y_t
- Email: tutorcs@163.com points to the term $\alpha(y_t - \hat{y}_t)$
- QQ: 749389476 points to the term $\alpha(y_t - \hat{y}_t)$
- <https://tutorcs.com> points to the term $\alpha(y_t - \hat{y}_t)$

Example (Class Activity)

- The process of exponential smoothing when $\alpha = 0.6$

Observed	Forecast	Error
55	55.0	0.00
59	55.0	4.00
53	57.4	-4.40
48	54.8	-6.76
44	50.7	-6.70
50	46.7	3.32
	48.6	and so on ...

WeChat: cstutorcs

The Value of a

$a = 0.1$

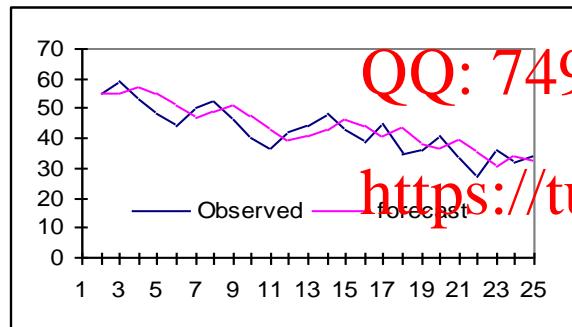

$a = 0.3$

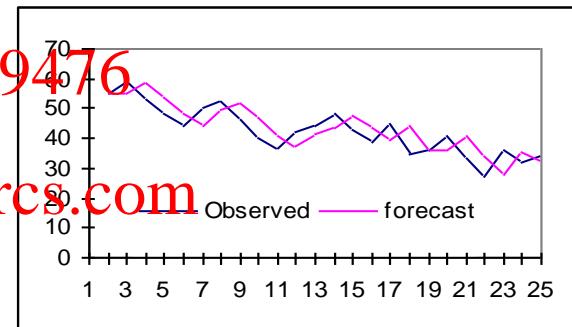

$a = 0.6$

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Forecast Accuracy

- One approach to measuring the accuracy of a forecast is to use the Absolute Percent Error (MAPE). This is the average error of a series of forecasts.

WeChat: cstutorcs

$$MAPE = \frac{1}{n} \sum_{i=1}^n \frac{|\hat{y}_i - y_i|}{y_i}$$

\hat{y}_i = forecast at period i

QQ: 749389476

y_i = actual value at period i

n = number of terms evaluated

Example

程序代写代做 CS编程辅导

	Alpha =		APE
Data	Forecast		
4	4.00		
7	4.00		0.43
9	4.90	4.10	0.46
12	6.13	5.87	0.49
3	7.89	-4.89	1.63
6	6.42	0.42	0.07
4	6.30	-2.30	0.57
8	5.61	2.39	0.30
6	6.33	-0.33	0.05
9	6.23	2.77	0.31
8	7.06	0.94	0.12
4	7.34	-3.34	0.84
5	6.34	1.34	0.27
2	5.94	-3.94	1.97

We don't include first value as it is not a forecast.

$$APE = \frac{|\hat{Y}_i - y_i|}{y_i}$$

WeChat: cstutorcs
Assignment Project Exam Help
Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

$$MAPE = \frac{1}{n} \times \sum_{i=1}^n \frac{|\hat{Y}_i - y_i|}{y_i}$$

FIT1006 Business Information Analysis – Lecture 09

A common technique for exponential smoothing is to choose an α that minimises MAPE using the Excel Solver.

This is the average value of the APE

Summary

程序代写代做 CS编程辅导

You should be able to:

- Plot a time series.
- Recognise the 3 components of a time series:
 - Trend; **WeChat: cstutorcs**
 - Seasonal or cyclic component; **Assignment Project Exam Help**
 - Random fluctuations (or noise). **Email: tutorcs@163.com**
- Construct a moving average. **QQ: 749389476**
- Make a one period forecast using exponential smoothing. **<https://tutorcs.com>**
- Know the effect of different values of α .
- Calculate the accuracy of a forecast using MAPE.
