Motivating Problem

- Would Labor 程序代写代做 CS编程辅导 have an election today?

- The Australia..... poll had the two-party preferred vote at: ALP 51% vs Coalition (Liberal) 49% from a sample of 1,160 people chosen at random (taken on 25 April 2021).

- Hint: Find a 95% CI for the expected Liberal-NP vote.

- Ref: http://www.theaustralian.com.au/national-affairs/newspoll

MONASH University
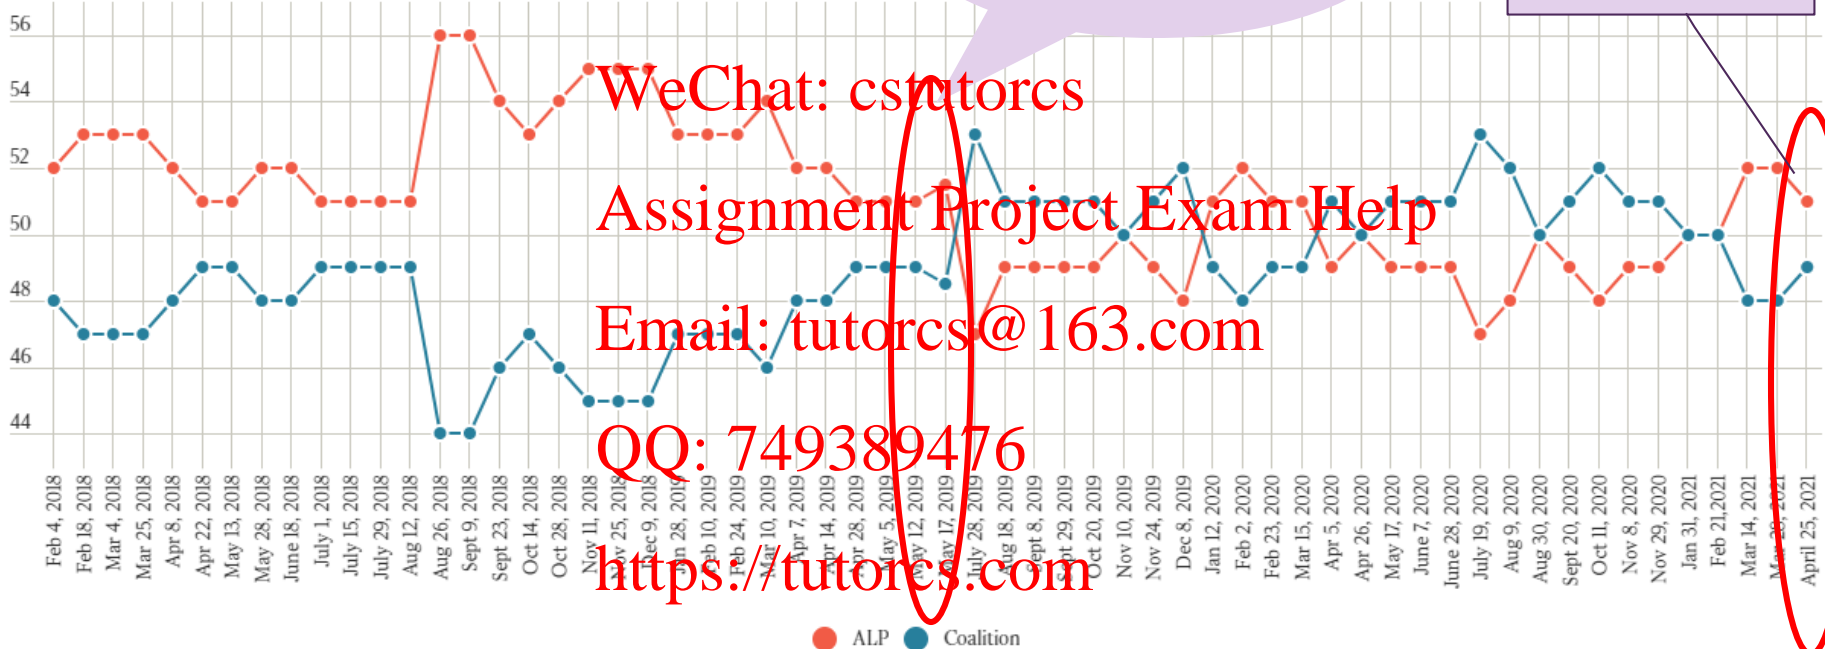

Who will win the election?

Two-party preferred

Preference flows based on recent federal and state elections

How did it turn out for the May 2019 election?

ALP (Labor) 51% vs Coalition (Liberal) 49% from a sample of 1,160 people chosen at random

Australia's conservative party retains power in shocking election result

The Labor Party has lost the "unloseable" election.

And while polls had narrowed in recent weeks, Labor remained clearly in front, with some pundits now blaming the "**shy Tory factor**" (essentially people telling pollsters they plan to vote for one before actually voting for another) for this surprise upset. On-air commenters in Australia are questioning whether they can ever really trust polling again…

Labor has lost the "unloseable" election

The Labor Party was widely favored to win this election — so much so that popular gambling website Sportsbet opted to pay out to Labor-backers **two days early**, to the tune of $1.3 million (there was no such luck then or now for the man who placed a record-breaking **$1 million bet on Labor** on rival site Ladbrokes).

Prime Minister Scott Morrison and his family celebrate his party's surprise win. | Tracey Nearmy/Getty Images

Estimates

- Two types of estimates:

- Point Estimates, where we estimate the actual (exact) value of a population parameter.

- Because point estimates are rarely correct it is more usual to define an Interval Estimate. This the range over which we expect the value of the population parameter vary with a given level of confidence.

Estimation, main characters:

程序代写代做 CS编程辅导

Parameter	Population	Sample
Mean	μ	$\bar{x}$
Standard Deviation	σ	s
Proportion	π	p

WeChat: cstutorcs

Assignment Project Exam Help

$\sigma_{\bar{x}} = $ standard error of the sample mean

Email: tutorcs@163.com

$\sigma_p = $ standard error of the sample proportion

QQ: 749389476

The sample values are used to estimate the <u>unknown</u> population parameters, taking into account variability introduced by sampling.

https://tutorcs.com

Deriving a confidence interval

In the following, a confidence interval is derived based on understanding of the Normal distribution.

To simplify learning the basic technique, this lecture assumes that we know the population variance (*not true in practice*) or that the sample size is large enough that the Central Limit Theorem is true.

In the following, the model is adjusted for the case when sample sizes are small and the population variance is unknown.

MONASH University

Question 1:

What is the z value 95% CI?

A. 0.510

B. 0.829

C. 1.645

✓ D. 1.96

z = - 1.96

$\bar{x}$

z = 1.96

95 % C.I. for μ

- Problem: using a sample taken from a population, estimate population mean, μ, using $\overline{x}$ and σ known.

- Construct a 95% C.I. for the population mean.

- Standardised error of the estimate is $\dfrac{\mu - \overline{x}}{\sigma_{\overline{x}}}$.

$$\dfrac{\mu - \overline{x}}{\sigma_{\overline{x}}}$$

-4.0   -3.0   -2.0   -1.0   0.0   1.0   2.0   3.0   4.0

MONASH University
95 % C.I. for μ

- Rescale the distribution, by un-standardising so now:

$$P(\bar{x} - 1.96\sigma_{\bar{x}} < \mu < \bar{x} + 1.96\sigma_{\bar{x}}) = 0.95$$

So a 95% C.I. for μ is : $\mu = \bar{x} \pm 1.96\sigma_{\bar{x}}$

$$\sigma_{\bar{x}} = \frac{\sigma}{\sqrt{n}}.$$

$$-3\sigma_{\bar{x}} \quad -2\sigma_{\bar{x}} \quad -\sigma_{\bar{x}} \quad \bar{x} \quad \sigma_{\bar{x}} \quad 2\sigma_{\bar{x}} \quad 3\sigma_{\bar{x}}$$

95 % C.I. for μ

- Algebraic derivation (you can skip if you want)

The true value of the population mean is μ which is unknown.

Take a sample, calculate $\bar{x}$ and s (sample mean and st dev).

The standard error (deviation) of $\bar{x}$ is $\sigma_{\bar{x}}$ which is unknown.

The standardised error of the estimate of μ is $\dfrac{\bar{x} - \mu}{\sigma_{\bar{x}}}$,

which has a normal $N(0,1)$ distribution.

MONASH University

95 % C.I. for μ continued

■ Algebraic derivation (you can skip if you want)

$P(-1.96 < z < 1.96) = 0.95$

So $P(-1.96 < \dfrac{\bar{x} - \mu}{\sigma_{\bar{x}}} < 1.96) = 0.95$, manipulating

$P(-1.96\sigma_{\bar{x}} < \bar{x} - \mu < 1.96\sigma_{\bar{x}}) = 0.95$

$P(\bar{x} - 1.96\sigma_{\bar{x}} < \mu < \bar{x} + 1.96\sigma_{\bar{x}}) = 0.95$

Thus a 95% C.I. for μ based on the sample mean $\bar{x}$ is :

$\mu = \bar{x} \pm 1.96\sigma_{\bar{x}}$

Finally, $\sigma_{\bar{x}} = \dfrac{\sigma}{\sqrt{n}}$ to calculate C.I.

Example

程序代写代做 CS编程辅导

- A sample of 100 students were sampled and their age recorded.

  Summary statistics: $\bar{x} = 20.1, \ \sigma = 1.2$

- Calculate a 95% C.I. for μ, the average age of students at the university.

$$\mu = \bar{x} \pm 1.96\sigma_{\bar{x}} \text{ where } \sigma_{\bar{x}} = \frac{\sigma}{\sqrt{n}}.$$

$$\mu = 20.1 \pm 1.96\frac{1.2}{\sqrt{100}} = 20.1 \pm 1.96 \times 0.12$$

95 % C.I. for π

程序代写代做 CS编程辅导

- In the same way as μ was estimated:

$$P(p - 1.96\sigma_p < \pi < p + 1.96\sigma_p) = 0.95$$

So a 95% C.I. for π is : $\pi = p \pm 1.96\sigma_p$

WeChat: cstutorcs

Estimate $\sigma_p = \sqrt{\dfrac{p(1-p)}{n}}$ Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

https://tutorcs.com

$-3S_p \quad -2S_p \quad -S_p \quad \bar{x} \quad S_p \quad 2S_p \quad 3S_p$

Example

- A sample of 100 students were sampled and 12 left-handed students counted.

- Calculate a 95% C.I. for π, proportion of left-handed students at the university.

$$\pi = p \pm 1.96\sigma_p \text{ where } \sigma_p = \sqrt{\frac{p(1-p)}{n}}$$

$$\pi = 0.12 \pm 1.96\sqrt{\frac{(0.12)(0.88)}{100}} = 0.12 \pm 1.96 \times 0.032$$

Significance 程序代写代做 CS编程辅导

- Significance is the probability that the C.I. does not contain the population statistic.

- Significance = 1- Confidence. So a 95% confidence has a significance, *a* = 0.05.

Significance = 0.05

This area = *a/2*

MONASH University
A General C.I. for μ and π

- Based on the normal distribution a confidence interval at the *a* significance level:

$$\mu = \bar{x} \pm z_{a/2}\sigma_{\bar{x}} \text{ where } \sigma_{\bar{x}} = \frac{s}{\sqrt{n}}$$

- The sample standard deviation *s* is used as an estimate of the population standard deviation, σ.

- The C.I. for p is created the same way.

$$\pi = p \pm z_{a/2}\sigma_p \text{ where } \sigma_p = \sqrt{\frac{p(1-p)}{n}}$$

https://flux.qa (Feed code: SJ6KGV

Question 2

If the sample size increases, the width of the corresponding confidence interval will:

✓ A. decrease,

B. be unaffected,

C. increase,

D. varies, depending on the data.

https://flux.qa (Feed code: SJ6KGV

Question 3

If the confidence increases, the width of the confidence interval will:

A. decrease,

B. be unaffected,

✓ C. increase,

D. varies, depending on the data.

Motivating Problem

- Would Labor win on a Federal Election if an election is to be held today?

- The Australian Newspoll had the two-party preferred vote at: Labor 51% Liberal-NP 49% from a sample of 1,160 people chosen at random.

- Hint: Find a 95% CI for the expected Liberal-NP vote.

- Ref: http://www.theaustralian.com.au/national-affairs/newspoll

Motivating Problem: Group Activity

- Find a 95% CI for expected Labor vote.

- p = 0.51, n = 1,160

- The 95% CI is: $\pi = p \pm 1.96\,\sigma_p, \quad \sigma_p = \sqrt{\frac{p(1-p)}{n}}$

$$\pi = 0.51 \pm 1.96\sqrt{\frac{0.51 * 0.49}{1160}} = 0.51 \pm 0.029$$

- LCL (Lower Confidence Limit) = 0.51 − 0.029 = 0.481

- UCL (Upper Confidence Limit) = 0.51 + 0.029 = 0.539

Sums and Differences of Variables

- Consider two independent random variables, X and Y:

  - $E(X + Y) = E(X) + E(Y)$

  - $E(X - Y) = E(X) - E(Y)$

  - $Var(X + Y) = Var(X) + Var(Y)$

  - $Var(X - Y) = Var(X) + Var(Y)$

- Rule: always add variances.

The Difference of Means

Consider t wo populations 1 and 2 with means μ_1 and μ_2.

Let σ_1^2 and σ_2^2 be the population variances .

We take samples of size n_1 and n_2.

Let $\overline{X}_1$ and $\overline{X}_2$ be the sample means, Then :

$E(\overline{X}_1 - \overline{X}_2) = \mu_1 - \mu_2$

$$Var(\overline{X}_1 - \overline{X}_2) = \frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2} = \sigma_{\overline{X}_1 - \overline{X}_2}^2$$

The Difference of Proportions

Consider two populations 1 and 2 with population proportions π_1 and π_2.

We take samples of size n_1 and n_2

Let P_1 and P_2 be the sample proportions

Then :

$$E(P_1 - P_2) = \pi_1 - \pi_2$$

$$Var(P_1 - P_2) = \frac{\pi_1(1-\pi_1)}{n_1} + \frac{\pi_2(1-\pi_2)}{n_2}$$

Difference of means and proportions

■ When finding the confidence interval for the difference of means and proportions use the following to calculate standard error.

$$\sigma_{\bar{x}_1 - \bar{x}_2} = \sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}$$

$$\sigma_{p_1 - p_2} = \sqrt{\frac{p_1(1-p_1)}{n_1} + \frac{p_2(1-p_2)}{n_2}}$$
